An Ubbelohde type viscometer or suspended-level viscometer is a measuring instrument which uses a capillary based method of measuring viscosity. It is recommended for higher viscosity cellulosic polymer solutions. The advantage of this instrument is that the values obtained are independent of the total volume. The device was developed by the German chemist Leo Ubbelohde (1877-1964).

The flow time must not fall below a specified minimum, otherwise the flow inside the capillary will no longer be laminar.. If a flow cup is used, the principle works as described above, but instead of

exact capillary dimensions, the volume of the cup and its outlet capillary need to be accurately defined.
