Volume Of A Solid Practice

The volume of a solid body is the amount of "space" it occupies. Volume has units of length cubed (i.e., cm^3 , m^3 , in^3 , etc.) For example, the volume of a box (cuboid) of length L , width W , and height H is given by $V=L \times W \times H$. The volume can also be computed for irregularly-shaped and curved solids such as the cylinder and cone. The volume of a surface of revolution is particularly simple to ...

Let's do some solid geometry volume problems. So they tell us, shown is a triangular prism. And so there's a couple of types of three-dimensional figures that deal with triangles. This is what a triangular prism looks like, where it has a triangle on one, two faces, and they're kind of separated ...

In this section, the first of two sections devoted to finding the volume of a solid of revolution, we will look at the method of rings/disks to find the volume of the object we get by rotating a region bounded by two curves (one of which may be the x or y -axis) around a vertical or horizontal axis of rotation.
