Crisscross method. The Thorpe's Crisscross method is a method of finding out the chemical formula of a metal and non-metal that combine to form an ionic bond created by high school chemistry teacher Kim Thorpe. To use this method, the absolute value of the oxidation number of the first ion is used as the subscript of the second, and vice versa.

Crisscross method - Wikipedia

If the criss-cross method does not work, use the traditional method of writing a formula. First, determine the ions present in the compound. Magnesium nitride has magnesium and nitrogen ions. Then write the symbol for each ion with the charge above it. Positively charged ions should be written first. For magnesium nitride, the ions are Mg²⁺ and N³⁻.

What Is the Crisscross Method in Chemistry? | Reference.com

Writing the chemical formula for ionic compounds is fairly easy. Write the cation symbol, then the anion symbol. Write the respective charges for each one. Find the lowest common multiple for the ions to make the compound neutral. An alternative to the third step is the drop and swap method.
