A parabola (plural "parabolas"; Gray 1997, p. 45) is the set of all points in the plane equidistant from a given line L (the conic section directrix) and a given point F not on the line (the focus). The focal parameter (i.e., the distance between the directrix and focus) is therefore given by $p=2a$, where a is the distance from the vertex to the directrix or focus.

Camera lens often have an antireflective coating. This thin film of transparent material reflects part of the light at the first surface and part at the second. The two reflected waves interfere destructively to cancel out the reflection. Here is an animation from Paul Falstad. This is a wave incident on an antireflective layer. This is the same wave but no antireflective layer. Have a look at (HL ...

Discussion dilemma. Under the right circumstances light can be used to push electrons, freeing them from the surface of a solid. This process is called the photoelectric effect (or photoelectric emission or photoemission), a material that can exhibit this phenomena is said to be photoemissive, and the ejected electrons are called photoelectrons; but there is nothing that would distinguish them ...
