We have observed that an increase in the tension of a string causes an increase in the velocity that waves travel on the string. In this activity we will examine the precise relationship between tension (T) the force applied to the string, the wave speed (v_w) and the linear mass density of the string ($\mu = m/L$ which is measured in kg/m).

Notice that at the endpoints, when $v = 0$, the mass has no kinetic energy, $KE = \frac{1}{2}mv^2$. Therefore, all of its energy is in the form of elastic potential energy, $PE_e = \frac{1}{2}kx^2$. When PE_e is maximum, the restoring force within the spring is also maximized resulting in the mass' acceleration also being maximized as the spring acts to return the mass to its equilibrium position.
