I am currently learning about Big O Notation running times and amortized times. I understand the notion of $O(n)$ linear time, meaning that the size of the input affects the growth of the algorithm proportionally...and the same goes for, for example, quadratic time $O(n^2)$ etc..even algorithms, such as permutation generators, with $O(n!)$ times, that grow by factorials.

Since the x in the second equation has a coefficient of 1, that would mean we would not have to divide by a number to solve for it and run the risk of having to work with fractions (YUCK). The easiest route here is to solve the second equation for x , and we definitely want to take the easy route.

Recursion (adjective: recursive) occurs when a thing is defined in terms of itself or of its type. Recursion is used in a variety of disciplines ranging from linguistics to logic. The most common application of recursion is in mathematics and computer science, where a function being defined is applied within its own definition. While this apparently defines an infinite number of instances ...
