There is another interesting empirical use of d_{10} . In the experimental work and calculation of solute-transport in saturated- and unsaturated-soils, the molecular diffusion term, D^* , (that is difficult to be determined) is usually "approximated" by multiplying the mean effective water velocity, v_x , by d_{10} and then dividing by Péclet number, P ,

Why is D10 called effective diameter (geotechnical ...

The phospholipids all contain a chiral center at the C 2 position of the glyceryl moiety and are therefore capable of existing in two configurations, which by convention are labeled R and S. All naturally occurring plant phospholipids have the R configuration, as illustrated later, and can therefore display optical activity. Some examples are given in Table 4-1.
