Spherical trigonometry is the branch of spherical geometry that deals with the relationships between trigonometric functions of the sides and angles of the spherical polygons (especially spherical triangles) defined by a number of intersecting great circles on the sphere. Spherical trigonometry is of great importance for calculations in astronomy, geodesy and navigation.

The six trigonometric functions can be defined as coordinate values of points on the Euclidean plane that are related to the unit circle, which is the circle of radius one centered at the origin O of this coordinate system. While right-angled triangle definitions permit the definition of the trigonometric functions for angles between 0 and radian ( $90^\circ$ ), the unit circle definitions allow to ...

Why should I know the generic right triangle? Given a right triangle, the trig function values for the two acute angles [angles smaller than a right angle] can be computed without knowing the angles.

Pythagoras. Pythagoras' Theorem says that for a right angled triangle, the square of the long side equals the sum of the squares of the other two sides:  $x^2 + y^2 = 1^2$ . But  $1^2$  is just 1, so:  $x^2 + y^2 = 1$  (the equation of the unit circle). Also, since  $x = \cos$  and  $y = \sin$ , we get:  $(\cos(\theta))^2 + (\sin(\theta))^2 = 1$  a useful "identity" Important Angles:  $30^\circ$ ,  $45^\circ$  and  $60^\circ$ . You should try to remember ...

The trigonometric functions For now let us restrict ourselves to right triangles. This means that angle  $\theta$  must have a value between  $0^\circ$  and  $90^\circ$ . Notice that if the triangle is scaled up in size then the sides get longer, but the ratio of the lengths of any two sides does not change. It is possible to define six different ratios.

If you are super-picky, then yes, there is a slight difference but no one would complain if you ignored the difference. For the more general case of parallaxes observed from any planet, the distance to the star in parsecs  $d = ab/p$ , where  $p$  is the parallax in arc seconds, and  $ab$  is the distance between the planet and the Sun in AU.. Formula (1) relates the planet-Sun baseline distance to the ...

Trigonometry - Principles of trigonometry: A somewhat more general concept of angle is required for trigonometry than for geometry. An angle  $A$  with vertex at  $V$ , the initial side of which is  $VP$  and the terminal side of which is  $VQ$ , is indicated in the figure by the solid circular arc. This angle is generated by the continuous counterclockwise rotation of a line segment about the point  $V$  from ...
