Vector Analysis By Schaum Series

In 3-dimensional geometry, for a finite planar surface of scalar area S and unit normal \hat{n} , the vector area \mathbf{S} is defined as the unit normal scaled by the area: $\mathbf{S} = S \hat{n}$. For an orientable surface S composed of a set S_i of flat facet areas, the vector area of the surface is given by $\mathbf{S} = \sum S_i \hat{n}_i$ where \hat{n}_i is the unit normal vector to the area S_i . For bounded, oriented curved surfaces that are ...

In mathematics, a unit vector in a normed vector space is a vector (often a spatial vector) of length 1. A unit vector is often denoted by a lowercase letter with a circumflex, or "hat": \hat{u} (pronounced "i-hat"). The term direction vector is used to describe a unit vector being used to represent spatial direction, and such quantities are commonly denoted as \mathbf{d} .

An $n \times n$ complex matrix A is called positive definite if $\text{Re}(x^*Ax) > 0$ (1) for all nonzero complex vectors x in \mathbb{C}^n , where x^* denotes the conjugate transpose of the vector x . In the case of a real matrix A , equation (1) reduces to $x^T Ax > 0$, (2) where x^T denotes the transpose. Positive definite matrices are of both theoretical and computational importance in a wide variety of applications.
