In elementary geometry, a polygon (/ ˈ p ɒ l ɪ g ɒ n /) is a plane figure that is described by a finite number of straight line segments connected to form a closed polygonal chain or polygonal circuit.The solid plane region, the bounding circuit, or the two together, may be called a polygon.. The segments of a polygonal circuit are called its edges or sides, and the points where two edges ...

Determining the inclusion of a point P in a 2D planar polygon is a geometric problem that results in interesting algorithms. Two commonly used methods are: The Crossing Number (cn) method - which counts the number of times a ray starting from the point P crosses the polygon boundary edges. The point is outside when this "crossing number" is even; otherwise, when it is odd, the point is inside.

The cross product measures the degree of perpendicular-ness of two vectors. Imagine that each edge of your polygon is a vector in the x-y plane of a three-dimensional (3-D) xyz space. Then the cross product of two successive edges is a vector in the z-direction, (positive z-direction if the second segment is clockwise, minus z-direction if it's counter-clockwise).

How would I "inflate" a polygon? That is, I want to do something similar to this: The requirement is that the new (inflated) polygon's edges/points are all at the same constant distance from the old (original) polygon's (on the example picture they are not, since then it would have to use arcs for inflated vertices, but let's forget about that for now ;)).
